

# **Object-Oriented Systems Development: Survey of Structured Method**

A.G. Sutcliffe, 1991

# 목 차

- ◆ **Object-Oriented Concepts**
- ◆ **Evaluation of modeling components**
- ◆ **Evaluation Procedure**
- ◆ **Object-Oriented Methods**
- ◆ **Structured Methods**
- ◆ **Conclusions**

# Object-Oriented Concepts

- ◆ **Three principles that make OOD to improve software design for reliability and maintenance.**
- ◆ **Abstraction: Objects are an abstraction of parts of real-world. More maintainable and reusable.**
- ◆ **Encapsulation: Objects hide their internal contents from other components to improve maintainability.**
- ◆ **Inheritance: By organizing objects in class hierarchies to promote reuse.**

# Evaluation of Modeling Components

## ◆ Object V.S Traditional Concepts of Entities and Functions

- ◆ Objects are close to entity concept. I.e. a collection of attributes, objects add activities to entity
- ◆ Objects are a type with one or more instance of type, same as entity-type concept
- ◆ Object instances may be changed by events and record state changes

# Evaluation of Modeling Components

- ◆ **Booch divides objects into actors, agents, and servers**
- ◆ **Actors are object that perform actions which influence other objects in the system**
- ◆ **Servers are the recipients of an actor's activity and related to the database entity concept**
- ◆ **Agents are an amalgam of both characteristics**

# Evaluation Procedure

## ◆ Conceptual modeling

- ◆ The data and processing control parts of a system are modeled in one unit rather than separately
- ◆ The method produces model of objects communicating by messages
- ◆ Classification of objects is supported with property inheritance

# Evaluation Procedure

## ◆ Procedure and Guidance

- ◆ The method should guide the analyst towards identifying and describing objects
- ◆ Guidance should be available for analysis, specification and design phases

## ◆ Transformations and products

- ◆ Design transformation should support change of OO specifications into designs implementable in OOP languages

# Object-Oriented Methods

## ◆ Hierarchical Object-Oriented Design(HOOD)

- ◆ HOOD supports object classes

- ◆ But HOOD Real-Time design method

- ◆ Inheritance specification is not detailed

- ◆ Reuse support is not explicit

# Object-Oriented Methods

## ◆ Object-Oriented System Design(OOSD)

- ◆ OOSD provides a detailed notation for object class and manage of inheritance
- ◆ OOSD supplies detailed notation for encapsulation
- ◆ The notation can become overcrowded and difficult to read

# Object-Oriented Methods

- ◆ **Object-Oriented System Analysis(OOSA)**
  - ◆ OOSA is prototyping approach
  - ◆ Main criticism of OOSA is its lack of support for inheritance
  - ◆ Reuse is not explicitly supported

# Object-Oriented Methods

## ◆ Object-Oriented Analysis (OOA)

- ◆ OOA cover all OO concepts, although it is an analysis method
- ◆ Abstraction is helped by the structured layer
- ◆ Specification of encapsulation is not as detailed as in OOSD or HOOD

# Object-Oriented Methods

## ◆ ObjectOry(Object Oriented Methology)

◆ This method supports OO concepts of classification, encapsulation and inheritance

◆ ObjectOry adds concepts of “uses case” to OO approach

◆ Consequently, no complete OO method exists

# Object-Oriented Methods

| Method    | Abstraction | Classification | Inheritance | Encapsulation | Coverage (R-A-S-D-I) |
|-----------|-------------|----------------|-------------|---------------|----------------------|
| HOOD      | Y           | Y              | Partial     | Y             | -----                |
| OOSD      | Y           | Y              | Y           | Y             | -----                |
| OOSA      | Y           | Partial        | -           | -             | -----                |
| OOA       | Y           | Y              | Y           | -             | -----                |
| ObjectOry | Y           | Y              | Y           | Partial       | -----                |

R-A-S-D-I: Requirements, Analysis, Specification, Design and Implementations

Feature analysis of Object-Oriented methods

# Structured Methods

- ◆ **Information Engineering (IE)**

- ◆ Encourage data modeling

- ◆ Functional specification uses process dependency and action diagram, separated from data modeling

# Structured Methods

- ◆ **Information System Activity and Change Analysis (ISAC)**
  - ◆ ISAC advocates top-down functional decomposition of processing and data
- ◆ **Structure Analysis/Structured Design (SASD)**
  - ◆ SASD use top-down functional decomposition to analyse system in terms of a network of processes connected by dataflow messages
- ◆ **Structrued Systems Analysis and Design Method(SSADM)**
  - ◆ SSADM is a composite method derived from structured analysis, structured design and data analysis.

# Structured Methods

- ◆ **Structured Analysis and Design Technique (SADT)**
- ◆ **Jackson System Development (JSD)**
- ◆ **Nijssen's Information Analysis Method (NIAM)**
- ◆ **Mascot-3**

# Structured Methods

| Method | Functional Process | Data relationship | Event sequence | Coverage (R-A-S-D-I) | Application         |
|--------|--------------------|-------------------|----------------|----------------------|---------------------|
| IE     | Y                  | Y                 | Y              | -----                | IS                  |
| ISAC   | Y                  | Y                 | N              | -----                | IS                  |
| SASD   | Y                  | N                 | Y              | -----                | IS                  |
| SSADM  | Y                  | Y                 | Y              | -----                | IS                  |
| SADT   | Y                  | Y                 | N              | -----                | IS, RT              |
| JSD    | N                  | Y                 | Y              | -----                | IS, RT              |
| NIAM   | Y                  | Y                 | N              | -----                | IS (data intensive) |
| Mascot | Y                  | N                 | N              | -----                | RT                  |

IS: Information System, RT: real-time

Summary of method specification models and approaches

# Conclusion

- ◆ Use of a particular system development method will bias implementation of OO systems, OO design may not derived from any specification
- ◆ Data model and OO specification show considerable convergence. It is feasible to migrate from structured method such as JSD, IE and SSADM to OO Method.
- ◆ Functionally based development methods are less well suited to development of OO system.
- ◆ OO methods have yet proven in practice, they have little CASE tool support, lack of modeling techniques for reuse system development.
